

APURUPA

Senior Full Stack Developer

apurupa810@gmail.com | 734-278-7599 | github.com/apurupa810-dotcom/apurupa-portfolio

PROFESSIONAL SUMMARY

- Senior Full Stack Developer with 10+ years designing, building, and modernizing large-scale enterprise applications across banking, payments, retail, and telecom.
- Led a mission-critical financial platform's migration from Pivotal Cloud Foundry (PCF) to Azure Kubernetes Service (AKS), including Docker, Helm, and secure networking configuration.
- Deep expertise across the full stack — Java/Spring Boot microservices, Angular/React front ends, and Node.js backend-for-frontend layers.
- Strong focus on secure, compliant systems: OAuth2/OIDC authentication, API hardening, and PCI/PII/SOC2 regulatory compliance.
- Experienced building event-driven architectures with Kafka, RabbitMQ, and SQS/SNS, including dead-letter queues, retries, and idempotent processing.
- Track record mentoring junior developers, leading architecture discussions, and providing L3 production support.

TECHNICAL SKILLS

Languages	Java 8–21, Python, TypeScript, JavaScript (ES6+), SQL, PL/SQL
Frameworks	Spring Boot, Spring MVC, Spring Security, Spring Cloud, Hibernate/JPA, Node.js/Express
Frontend	Angular (4–18), React.js, Redux, Context API, Hooks, TypeScript, Storybook, Material UI, Bootstrap
Messaging	Kafka, RabbitMQ, ActiveMQ, SQS/SNS, JMS, event-driven & DLQ/retry patterns
Cloud	Azure (AKS, Key Vault, App Insights), AWS (EC2, S3, RDS, Lambda, API Gateway, IAM), Docker, Kubernetes, Helm
DevOps / CI-CD	Azure DevOps, Jenkins, GitHub Actions, AWS CodePipeline, SonarQube, Fortify, Checkmarx
Databases	Oracle, SQL Server, PostgreSQL, MySQL, MongoDB, DynamoDB/RDS
Monitoring	Splunk, Kibana, Grafana, App Insights, CloudWatch, ELK Stack
Testing	JUnit, Mockito, Jest, React Testing Library, Playwright, Cypress, Selenium, Postman
Security	OAuth2/OIDC, JWT, SAML, PCI-DSS, SOC2, RBAC

PROFESSIONAL EXPERIENCE

Navy Federal Credit Union | *Vienna, VA*

Senior Full Stack Developer *Apr 2021 – Present*

- Led the migration of the debit claims platform from Pivotal Cloud Foundry (PCF) to Azure Kubernetes Service (AKS), re-architecting service bindings into Kubernetes-native ConfigMaps, Secrets, and Azure Key Vault integrations.
- Redesigned the claims data model and API layer to support multi-claim submissions per debit dispute case, replacing the legacy single-claim-per-request architecture.
- Built new REST endpoints in Spring Boot to handle batch claim creation, validation, and status tracking across multiple linked disputes within a single case.
- Containerized Spring Boot microservices with Docker, implementing multi-stage builds to reduce image size and improve deployment speed during the AKS cutover.
- Authored Helm charts (Deployments, Services, Ingress, HPA, ConfigMaps, Secrets) to manage claims-service deployments across DEV, QA, SIT, UAT, and PROD.
- Operated production AKS clusters end-to-end — tuning HPA and node-pool scaling, managing Ingress and internal service networking, performing version upgrades, and serving as an on-call responder for cluster-level incidents (pod scheduling, resource contention, networking failures).
- Implemented OAuth2/OIDC-based authentication and authorization for claims APIs, aligning access control with PCI and SOC2 compliance requirements.

- Designed idempotent event processing for multi-claim submissions using RabbitMQ, including dead-letter queues and retry logic to prevent duplicate claim creation.
- Coordinated a phased blue-green cutover strategy from PCF to AKS to ensure zero downtime for claims processing during peak dispute volume periods.
- Refactored the Angular front end to support a multi-step, multi-claim dispute submission flow, replacing the prior single-claim form.
- Built reusable Angular components (multi-claim entry table, claim status dashboard, dispute summary view) published to a shared Storybook component library.
- Partnered with the Cloud Engineering team to replace PCF service discovery and config management with AKS-native patterns, reducing environment configuration drift.
- Implemented distributed tracing and correlation IDs across the claims service mesh to track individual claims within a multi-claim case end-to-end.
- Set up monitoring dashboards in App Insights and Grafana for the new multi-claim workflows, tracking submission success rates and processing latency.
- Conducted load and regression testing to validate that the migrated claims platform could handle increased throughput from multi-claim submissions without degrading response times.
- Mentored two junior developers through the PCF-to-AKS migration, pairing on Kubernetes fundamentals and Helm chart authoring.

American Express | *New York, NY*

Full Stack Developer *Sep 2020 – Mar 2021*

- Built interactive React dashboards for credit card transactions, statements, card controls, and dispute initiation, using TypeScript, Hooks, Context API, and Redux for state management.
- Developed reusable, validated UI components for multi-step workflows (payments, disputes, new card activation) with React Router-driven navigation and controlled error handling.
- Built a Node.js Backend-for-Frontend (BFF) layer to aggregate responses from 4–6 downstream microservices, reducing the number of network calls required by the React front end.
- Wrote Express middleware for request logging, data masking, rate limiting, and authentication/authorization, improving API security and consistency across the Node.js layer.
- Cut perceived latency on transaction-heavy screens by implementing client-side caching, debouncing, and automatic retry logic — reducing redundant API calls during peak traffic periods and improving reliability under load.
- Designed and built Spring Boot microservices for payments, statements, rewards, fraud alerts, and card management, using Java 8+ streams and CompletableFuture for efficient processing.
- Implemented REST APIs with pagination, filtering, and comprehensive input validation to support high-throughput credit card processing operations.
- Applied Spring Security for multi-role, method-level authorization on sensitive operations, ensuring compliance with PCI-DSS standards.
- Powered real-time fraud alerts and credit limit updates by integrating Kafka transaction event streams with SQS/SNS-driven serverless workflows, enabling near-instant downstream processing across a high-volume credit card platform.
- Architected auto-scaling AWS infrastructure (EC2, Lambda, API Gateway, RDS) to absorb traffic spikes during peak transaction periods without manual intervention, improving system resilience for a mission-critical financial platform.
- Wrote Lambda functions for asynchronous fraud checks and batch notification workflows, reducing reliance on always-on compute for event-driven tasks.
- Implemented OAuth2/JWT-based authentication with refresh token flows and secure cookie handling across both the Node.js and Spring Boot layers.
- Containerized Node.js and Spring Boot services with Docker using multi-stage builds, enabling consistent deployments through Jenkins and AWS CodePipeline.
- Added structured JSON logging and correlation IDs to trace requests end-to-end across Node.js, Java, and AWS services, improving production debugging.
- Served as a go-to L3 escalation point for production incidents on the credit card platform, driving root cause analysis to resolution, and mentored junior developers on React, Node.js, and cloud-native best practices — helping ramp new team members faster.

Little Caesars | *Detroit, MI*

Full Stack Developer *May 2018 – Aug 2020*

Built high-performance, statically generated web applications using Gatsby and GraphQL, delivering fast-loading, SEO-optimized pages with strong Lighthouse scores.

- Migrated legacy class-based React components to functional components using Hooks (useState, useEffect, useReducer, useContext), improving code readability and testability.
- Developed and documented reusable, production-ready UI components in Storybook with accessibility checks, accelerating design-system consistency across teams.
- Managed a multi-package monorepo using Lerna, coordinating independent versioning and dependency alignment across shared component libraries.
- Established a themeable styling foundation using Styled Components and Styled System, ensuring consistent design language and faster UI development cycles.
- Adopted Test-Driven Development, writing Jest unit/snapshot tests first to maintain high coverage and confidence during frequent refactors.
- Automated end-to-end testing with Cypress and Playwright, scripting realistic user flows and API mocking to catch regressions before they reached production.
- Performed user-focused component testing with React Testing Library, prioritizing accessible, behavior-driven test coverage over implementation details.
- Designed and built RESTful APIs using Spring Boot and Spring MVC, handling order processing and user management with proper versioning and error handling.
- Modeled and managed relational data using Spring Data JPA and PostgreSQL, optimizing queries and transactions to support application scalability.
- Implemented JWT and OAuth-based authentication, and hardened APIs against CSRF, XSS, and injection attacks to protect user data.
- Tuned application performance using Redis caching and asynchronous processing, reducing latency for high-traffic endpoints.
- Wrote backend test coverage using JUnit, Mockito, and Spring Boot Test across services, controllers, and repositories to ensure reliable releases.
- Documented APIs using OpenAPI, generating interactive specs that improved cross-team integration and onboarding.
- Configured CI/CD pipelines (Jenkins, GitHub Actions) to automate builds, tests, and deployments across the JavaScript/Java stack, reducing manual release effort.

Cox Communications | *Hyderabad, India*

Full Stack Developer *Jun 2013 – Dec 2015*

- Developed and maintained single-page Angular 4 applications for internal customer management systems, using RxJS for reactive state management.
- Designed Spring MVC-based backend architecture (controllers, services, DAOs) for telecom billing and customer support workflows.
- Built and secured RESTful endpoints using Spring Security and AOP-based logging for sensitive customer data handling.
- Used Spring Boot Actuator, Spring Cloud, and Netflix Eureka for microservice health checks and service discovery.
- Optimized complex PL/SQL stored procedures and queries to support high-volume telecom reporting and analytics.
- Automated build and test pipelines using Grunt and Jenkins CI, reducing manual release effort.
- Built Selenium test scripts to validate end-to-end business workflows and API integrations.
- Provided L3 production support, performing log analysis and resolving API, UI, and database issues.

EDUCATION

- Master's Degree in Computer Information Systems — New England College, Henniker, NH (2016 – 2018)
- Bachelor's Degree in Computer Science — Jawaharlal Nehru Technological University (JNTU), Hyderabad, India
